

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are short prismatic, to $5\ \mu\text{m}$, in granular aggregates.

Physical Properties: Hardness = 1.5–2 $D(\text{meas.}) = \text{n.d.}$ $D(\text{calc.}) = 2.85$

Optical Properties: Translucent. *Color:* Turquoise-blue to sky-blue. *Luster:* Earthy. *Optical Class:* Biaxial. *Pleochroism:* $X = \text{blue}$; $Z = \text{colorless}$. $\alpha = 1.632(5)$ (α'). $\beta = \text{n.d.}$ $\gamma = 1.680(5)$ (γ'). $2V(\text{meas.}) = \text{n.d.}$

Cell Data: *Space Group:* $[I2/m]$ (by analogy to vivianite). $a = 9.889(15)$ $b = 13.225(11)$ $c = 4.645(4)$ $\beta = 102.41(11)^\circ$ $Z = 2$

X-ray Powder Pattern: Santa Catherina meteorite.

6.624 (100), 7.878 (26), 4.818 (24), 3.152 (24), 2.922 (23), 3.805 (21), 2.672 (17)

Chemistry:

	(1)	(2)
P_2O_5	27.60	27.83
FeO	4.53	
CoO	0.39	
NiO	40.18	43.92
H_2O	[27.30]	28.25
Total	[100.00]	100.00

(1) Santa Catherina meteorite; by electron microprobe, total Fe as FeO, H_2O by difference; corresponds to $(\text{Ni}_{2.78}\text{Fe}_{0.33}^{2+}\text{Co}_{0.03})_{\Sigma=3.14}(\text{PO}_4)_{2.01}\text{O}_{0.12} \cdot 7.84\text{H}_2\text{O}$. (2) $\text{Ni}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Mineral Group: Vivianite group.

Occurrence: A weathering product of a nickel-rich iron meteorite.

Association: Reevesite, honessite, akaganéite, hematite, goethite, magnetite.

Distribution: In the Santa Catherina iron meteorite.

Name: To honor Hans Henning Arup (1928–), Director of the Danish Corrosion Center, Copenhagen, Denmark.

Type Material: Division of Meteorites, National Museum of Natural History, Washington, D.C., USA, 659, 804, 877.
