Polymorphism & Series: Forms a series with pargasite.

Mineral Group: Calcium amphibole.

Occurrence: Along cracks in podiform chromitite deposits scattered in serpentinized dunite associated with rocks of the eclogite metamorphic facies; probably formed during retrograde metamorphism.

Association: Chromite, kämmererite, Cr-poor clinocllore, phlogopite, diopside, calcite, uvarovite.

Distribution: From the Akaishi mine, Higashi-Akaishi Mountain, Ehime Prefecture, Japan.

Name: Originally *ehimeite* for the type locality; subsequently changed to *chromio-pargasite* to conform to IMA nomenclature for a chromium-dominant analog of *pargasite*.

Type Material: National Museum of Nature and Science, Tokyo, Japan (NSM-M41160).
