

Crystal Data: Cubic. *Point Group:* $4/m\bar{3}2/m$. Massive, scaly to platy, as exsolution lamellae parallel to {0001} of troilite, and as discrete grains to 500 μm across in kamacite.

Physical Properties: *Cleavage:* Distinct. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5 VHN = 260–303 (100 g load). D(meas.) = 3.81 D(calc.) = 3.842

Optical Properties: Opaque. *Color:* Black. *Streak:* Brown. *Luster:* Metallic, brilliant. R: (400) 33.3, (420) 33.2, (440) 33.1, (460) 33.0, (480) 33.1, (500) 33.1, (520) 33.1, (540) 33.0, (560) 33.0, (580) 32.9, (600) 32.8, (620) 32.7, (640) 32.4, (660) 32.3, (680) 32.1, (700) 31.9

Cell Data: *Space Group:* $Fd\bar{3}m$. $a = 9.966$ $Z = 8$

X-ray Powder Pattern: Synthetic.

3.01 (10), 1.77 (10), 3.53 (8), 2.50 (8), 1.92 (8), 1.30 (8), 1.25 (8)

Chemistry:

	(1)	(2)	(3)
Fe	20.10	16.7	19.38
Mn		2.8	
Mg		0.06	
Cr	35.91	34.9	36.10
Ti		0.10	
S	42.69	44.3	44.52
Total	98.70	98.86	100.00

(1) Coahuila meteorite; average of three analyses, corresponding to Fe_{1.08}Cr_{2.08}S_{4.00}.

(2) Blithfield meteorite; by electron microprobe, average of 15 analyses; corresponding to (Fe_{0.87}Mn_{0.15}Mg_{0.01})_{Σ=1.03}(Cr_{1.94}Ti_{0.01})_{Σ=1.95}S_{4.00}. (3) FeCr₂S₄.

Mineral Group: Linnaeite group.

Occurrence: In small amounts in many meteorites.

Association: Troilite, kamacite, orthoenstatite, plagioclase, alabandite, graphite, schreibersite.

Distribution: In iron meteorites, such as the Coahuila [TL], North Chile, and Scottsville hexahedrites, and the Cosby's Creek, Toluca, Cranbourne, and Mundrabilla octahedrites. In stony meteorites, including the Bustee, Mayo Belwa, Norton County, and Cumberland Falls achondrites, the Hvittis and Blythfield enstatite chondrites, and Odessa olivine-bronzite chondrite. Now found in many additional meteorites.

Name: For Professor Gabriel Auguste Daubrée (1814–1896), of Paris, France, French meteorite researcher.

Type Material: n.d. [??first from the Bolson de Mapimi iron meteorite - where is it?? = Coahuila now, ck??]
