

Hochelagaite

(Ca, Na, Sr)Nb₄O₁₁•8H₂O

(c)2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. Intimately intergrown with franconite, in bladed crystals, to 0.03 mm, radiating in globules, to 150 μ m, commonly with a granular core; in radial spherical aggregates and matted fibrous masses.

Physical Properties: *Tenacity:* Brittle; flexible when fibrous. *Hardness* = $\sim$ 4
D(meas.) = 2.89(1) D(calc.) = 2.883 May show a weak pale yellow fluorescence under SW and LW UV.

Optical Properties: Semitransparent. *Color:* White. *Streak:* White. *Luster:* Vitreous to silky.

Optical Class: Biaxial (-). *Orientation:* Z = elongation; X $\perp$ blades. α = 1.72(1)
 β = [1.81(1)] γ = 1.82(1) 2V(meas.) = 35(5) $^\circ$

Cell Data: *Space Group:* n.d. a = 19.98(2) b = 12.88(1) c = 6.446(6) β = 93.41(8) $^\circ$
Z = 4

X-ray Powder Pattern: Francon quarry, Canada.
10.0 (10), 3.115 (8), 3.208 (7), 5.39 (5), 4.96 (5b), 2.799 (4), 1.979 (3b)

Chemistry:

	(1)
Nb ₂ O ₅	75.3
Ta ₂ O ₅	0.0
SiO ₂	1.3
TiO ₂	1.4
Al ₂ O ₃	0.4
CaO	7.3
SrO	0.3
Na ₂ O	0.8
H ₂ O	[13.2]
Total	[100.0]

(1) Francon quarry and Mont Saint-Hilaire, Canada; by electron microprobe, average of eight analyses, H₂O by difference, considered to be partially dehydrated from 8–9 H₂O required to match measured densities; corresponds to (Ca_{0.84}Na_{0.16}Sr_{0.02}) $_{\Sigma=1.02}$ (Nb_{3.70}Si_{0.14}Ti_{0.11}Al_{0.05}) $_{\Sigma=4.00}$ O_{10.71}•5.47H₂O. (2) Saint-Amable, Canada; by electron microprobe, corresponding to (Ca_{0.87}Na_{0.13}) $_{\Sigma=1.00}$ (Nb_{3.81}Ti_{0.19}Mg_{0.05}) $_{\Sigma=4.05}$ O_{10.89}•8H₂O.

Occurrence: In vugs of a dawsonite-bearing sill in a limestone deposit (Francon quarry, Canada); in cavities in altered pegmatite dikes, hornfels, sodalite syenite, or miarolitic cavities, associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in miarolitic cavities in a syenite sill (near Saint-Amable, Canada).

Association: Franconite, weloganite, calcite, quartz (Francon quarry, Canada).

Distribution: In the Francon quarry, Montreal Island, Montreal, at Mont Saint-Hilaire, and near Saint-Amable, Quebec, Canada. From Vardeåsen, Langesundsfjord, Norway.

Name: For *Hochelaga*, an early name for Montreal, Canada and its surrounds, within which the mineral occurs.

Type Material: Geological Survey of Canada, Ottawa, 64285–64288; Royal Ontario Museum, Toronto, Canada, M37547, M37548.
