

Crystal Data: Hexagonal. *Point Group:* 6/m 2/m 2/m (probable). As granular inclusions to 50 μm and tabular lamellar intergrowths to 100 μm in corundum.

Physical Properties: *Cleavage:* Observed (synthetic). *Tenacity:* n.d. *Fracture:* n.d. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.52 (synthetic)

Optical Properties: Opaque (synthetic). *Color:* Black to dark brown (synthetic). *Streak:* n.d. *Luster:* Metallic (synthetic). *Optical Class:* n.d.

Cell Data: *Space Group:* P6/mmm (probable). $a = 3.04(6)$ $c = 3.22(6)$ $Z = 1$

X-Ray Diffraction Pattern: Cr-11 orebody, near Kangjinla, Luobusa ophiolite, Tibet, China. 2.029 (100), 2.615 (60), 3.218 (21), 1.510 (20), 1.211 (12), 1.370 (11), 1.101 (11)

Chemistry:	(1)	(2)	(3)
B	36.62	30.74	31.1
C	1.53	0.01	
V		2.68	
Cr		0.54	
Fe		0.28	
Ti	61.87	65.12	68.9
Total	100.02	99.37	100.0

(1) Cr-11 orebody, near Kangjinla, Luobusa ophiolite, Tibet, China; electron energy-loss spectroscopic analyses; corresponds to $\text{Ti}_{1.10}(\text{B}_{1.86}\text{C}_{0.05})_{\Sigma=1.91}$. (2) Israel; average electron microprobe analysis, total excludes low amounts of Al, Si, Mn, N, O. (3) TiB₂.

Occurrence: In corundum in a podiform chromitite in ophiolite (Tibet). As inclusions in skeletal corundum xenoliths in basaltic tuff (Israel).

Association: Osbornite-khamrabaevite solid solution ($\text{Ti}[\text{C}_{0.5}\text{N}_{0.5}]$), deltalumite, hexagonal $\text{Ti}_{10}(\text{Si,P},\square)_7$ (Tibet); Fe-Ti silicides, khamrabaevite, osbornite, Ca-Al-Mg silicate glass (Israel).

Distribution: From the Cr-11 orebody, near Kangjinla, Luobusa ophiolite, Tibet, China. At Mt. Carmel, northern Israel.

Name: Honors *Jingsui* Yang (b. 1950), Center for Advanced Research on the Mantle, Key Laboratory for Continental Dynamics, Institute of Geology, Chinese Academy of Geological Sciences for his contributions to the mineralogy of the chromitites of the Luobusa ophiolite.

Type Material: Geological Museum of China, Beijing, PR China, (M13816).
