

Manganvesuvianite

Crystal Data: Tetragonal. *Point Group:* 6. As prismatic, often striated, crystals, to 1.5 cm, with {100} dominant, {110} minor, and {101} termination. *Twinning:* Merohedral {110}.

Physical Properties: *Cleavage:* n.d. *Tenacity:* Brittle. *Fracture:* Subconchoidal. Hardness = 6-7 D(meas.) = n.d. D(calc.) = 3.404

Optical Properties: Transparent, opaque (thick crystals). *Color:* Maroon-red to black with dark red internal reflections. *Streak:* Colorless. *Luster:* Vitreous.

Optical Class: Uniaxial (-). $\epsilon = 1.731(1)$ $\omega = 1.719(1)$ *Pleochroism:* Strong, E = yellowish, O = dark red.

Cell Data: *Space Group:* $P4/n$. $a = 15.575(2)$ $c = 11.824(2)$

X-ray Powder Pattern: n.d. Chemically zoned material precluded a good pattern. Similar to other vesuvianite group members.

Chemistry:

	(1)
SiO ₂	36.15
Al ₂ O ₃	14.73
Fe ₂ O ₃	1.12
Mn ₂ O ₃	6.79
MgO	2.35
CaO	35.73
CuO	0.02
SrO	0.11
Na ₂ O	0.03
F	0.12
Cl	0.01
H ₂ O	[2.67]
-O = (F, Cl)	0.07
Total	99.76

(1) N'Chwaning II mine, South Africa; average electron microprobe analysis, H₂O calculated; corresponds to simplified formula Ca₁₉Mn³⁺(Al,Mn³⁺,Fe³⁺)₁₀(Mg,Mn²⁺)₂Si₁₈O₆₉(OH)₉.

Mineral Group: Vesuvianite group.

Occurrence: In calc-silicate lenses formed by hydrothermal alteration of primary sedimentary and low-grade metamorphic manganese ores.

Association: Grossular, xonotlite, calcite, serandite-pectolite, strontiopiemontite-tweddillite, mozartite, hydrogrossular, henritermierite.

Distribution: At the Wessels mine and N'Chwaning II mine [TL], Kalahari manganese fields, South Africa.

Name: Prefix, *mangan*, indicates a *vesuvianite* group mineral with the five-coordinated (Y') position occupied by Mn³⁺.

Type Material: Natural History Museum, Bern, Switzerland (NMBE 35474).
