

Metadelrioite

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\bar{1}$ or 1. Intimately intergrown in parallel orientation with delrioite, in radial fibrous aggregates of tiny acicular crystals.

Physical Properties: Hardness = ~ 2 D(meas.) = 4.3 D(calc.) = 4.21 Readily soluble in H_2O .

Optical Properties: Translucent. *Color:* Light yellow-green to darker green on exposed surfaces, probably the result of photoreduction of some of the vanadium. *Luster:* Vitreous to pearly.

Optical Class: Biaxial (-); properties composite with delrioite. *Pleochroism:* X = colorless; Y = pale yellow; Z = deeper yellow. *Orientation:* Z = elongation; extinction parallel. $\alpha = 1.783(3)$ $\beta = 1.834(3)$ $\gamma = 1.866(3)$ 2V(meas.) = Medium to large.

Cell Data: *Space Group:* $P\bar{1}$ or $P1$. $a = 7.343(7)$ $b = 8.382(3)$ $c = 5.117(4)$
 $\alpha = 111^\circ 39(2)'$ $\beta = 90^\circ 16(5)'$ $\gamma = 102^\circ 49(4)'$ Z = 2

X-ray Powder Pattern: Jo Dandy mine, Colorado, USA.
4.94 (s), 3.46 (s), 4.73 (ms), 2.683 (ms), 2.547 (m), 2.516 (m), 1.885 (m)

Chemistry:	(1)	(2)
V_2O_5	46.6	50.58
CaO	13.5	15.59
SrO	24.8	28.82
H_2O^+	5.7	5.01
H_2O^-	9.4	
Total	[100.0]	100.00

(1) Jo Dandy mine, Colorado, USA; an estimated 1:5 mixture with delrioite, $\text{CaSrV}_2\text{O}_6(\text{OH})_2 \cdot 3\text{H}_2\text{O}$, recalculated to 100% after deduction of quartz 1.30%.

(2) $\text{CaSrV}_2\text{O}_6(\text{OH})_2$.

Occurrence: An efflorescence on sandstone of the Salt Wash member of the Jurassic Morrison Formation associated with a U-V deposit.

Association: Delrioite, rossite, metarossite, quartz.

Distribution: From a dump at the Hummer portal of the Jo Dandy mine, Bull Canyon district, Paradox Valley, Montrose Co., Colorado, USA.

Name: For its relation to *delrioite* and its lesser H_2O content.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128296.
