(c)2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. Point Group: 2/m or 2. As elongate grains, to 4  $\mu$ m; in powdery, earthy to compact porcelaneous masses.

**Physical Properties:** Hardness = Very soft; 1–3 if porcelaneous. D(meas.) = n.d. D(calc.) = 2.60 Extremely soluble in  $H_2O$ .

Optical Properties: Translucent. Color: White; colorless in transmitted light. Luster: Dull. Optical Class: [Biaxial.] Orientation: Length-fast, nearly parallel extinction. Dispersion: r < v, (synthetic).  $\alpha = 1.490$   $\beta = \text{n.d.}$   $\gamma = 1.505$  2V(meas.) = 80° (synthetic).

**Cell Data:** Space Group:  $P2_1/m$  or  $P2_1$ . a = 5.47(1) b = 6.84(1) c = 5.45(1)  $\beta = 116.33(8)^{\circ}$  Z = 2

**X-ray Powder Pattern:** Big Fish River area, Canada. 2.803 (100), 2.720 (70), 3.84 (55), 3.97 (45), 2.868 (30), 3.41 (25), 2.650 (15)

Chemistry:

$$\begin{array}{cccc} & (1) & (2) \\ P_2O_5 & 49.54 & 49.99 \\ Na_2O & 43.67 & 43.66 \\ H_2O & [6.32] & 6.35 \\ \hline Total & [99.53] & 100.00 \\ \end{array}$$

- (1) Big Fish River area, Canada; colorimetric and AA analysis, H<sup>1+</sup> calculated for charge balance.
- (2)  $Na_2HPO_4$ .

Occurrence: An alteration product of maricite in nodules in phosphatic ironstone (Yukon Territory, Canada); in sodalite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in differentiated alkalic massifs (Kola Peninsula, Russia).

**Association:** Marićite (Yukon Territory, Canada); natrophosphate, villiaumite (Kola Peninsula, Russia).

**Distribution:** From the Big Fish River area, Yukon Territory, and at Mont Saint-Hilaire, Quebec, Canada. On Mt. Karnasurt, Lovozero massif and on Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.

**Name:** For the principal chemical components, sodium, NAtrium, Hydrogen, Phosphorus, and Oxygen.

Type Material: University of Saskatchewan, Saskatoon, Canada, 12504.
