

Tincalconite

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. Rare crystals are pseudo-octahedral, exhibiting $\{10\bar{1}1\}$, $\{01\bar{1}2\}$, and $\{0001\}$, to 1 cm; commonly as a powder.

Physical Properties: Hardness = n.d. $D(\text{meas.}) = 1.880$ $D(\text{calc.}) = 1.894$

Optical Properties: Transparent to translucent. *Color:* Colorless to white; colorless in transmitted light. *Luster:* Vitreous to dull.

Optical Class: Uniaxial (+). $\omega = 1.461$ $\epsilon = 1.474$

Cell Data: *Space Group:* $R\bar{3}2$. $a = 11.097(2)$ $c = 21.114(4)$ $Z = 9$

X-ray Powder Pattern: Synthetic. (ICDD 7-277).

2.92 (100), 4.38 (90), 8.75 (55), 3.44 (55), 2.187 (40), 4.71 (30), 3.00 (30)

Chemistry:

	(1)	(2)
B ₂ O ₃	47.52	47.80
Na ₂ O	20.80	21.28
H ₂ O	30.59	30.92
insol.	0.48	
Total	99.39	100.00

(1) Kramer district, California, USA. (2) Na₂B₄O₅(OH)₄•3H₂O.

Occurrence: Typically a dehydration product of other borates.

Association: Borax, kernite.

Distribution: Probably more widespread than the few recorded localities suggest. In the USA, from the Kramer borate deposit, Boron, Kern Co. and as crystals at Searles Lake, San Bernardino Co., California. From the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. In the Kirka borate deposit, Eskişehir Province, Turkey. At Larderello, Val di Cecina, Tuscany, Italy. From mud volcanoes, Kerch Peninsula, Ukraine.

Name: From *tincal*, an Oriental name for *borax*, and the Greek for *powder*, in allusion to the typical powdery habit.
