

Trigonite

$\text{Pb}_3\text{Mn}^{2+}(\text{As}^{3+}\text{O}_3)_2(\text{As}^{3+}\text{O}_2\text{OH})$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m . As crystals with a trigonal outline from development of many domatic forms, flattened on {010}, to 5 mm; in subparallel growths.

Physical Properties: *Cleavage:* {010}, perfect; {101}, good. *Fracture:* Uneven. Hardness = 2–3 $D(\text{meas.}) = 6.1\text{--}7.1$ $D(\text{calc.}) = 6.35$

Optical Properties: Translucent. *Color:* Sulfur-yellow to yellowish brown, dark brown; pale yellow to brownish yellow in transmitted light. *Luster:* Vitreous to adamantine.

Optical Class: Biaxial (–). *Orientation:* $Y = b$. *Dispersion:* $r < v$, observable. $\alpha = 2.07$ $\beta = 2.10$ $\gamma = 2.12$ $2V(\text{meas.}) = \text{Very large}$.

Cell Data: *Space Group:* Pn . $a = 7.258(3)$ $b = 6.822(4)$ $c = 11.088(6)$ $\beta = 94.45(4)^\circ$ $Z = 2$

X-ray Powder Pattern: Långban, Sweden.

2.99 (10), 3.08 (9), 3.24 (7), 4.90 (6), 4.50 (4), 3.65 (4), 2.76 (4)

Chemistry:

	(1)	(2)
As_2O_3	28.83	28.36
FeO	0.15	
MnO	6.79	6.78
PbO	63.40	64.00
MgO	0.11	
CaO	0.23	
Cl	trace	
H_2O	0.81	0.86
insol.	0.13	
Total	100.45	100.00

(1) Långban, Sweden; averages of several analyses. (2) $\text{Pb}_3\text{Mn}(\text{AsO}_3)_2(\text{AsO}_2\text{OH})$.

Occurrence: In a metamorphosed Fe–Mn orebody.

Association: Lead, dixenite, hausmannite, finnemanite, rouseite, dolomite, barite.

Distribution: At Långban, Värmland, Sweden.

Name: From the Greek for *triangle*, alluding to the characteristic crystal outline.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.
