Ni(OH)$_2$  Theophrastite

**Crystal Data:** Hexagonal. *Point Group:* $\overline{3} 2/m$. In minute crystals, platy or finely parallel fibrous, in botryoidal crusts, to 0.5 cm; may be interstratified with other layer-structure minerals.

**Physical Properties:** *Cleavage:* {0001}, perfect. *Fracture:* Conchoidal. *Hardness* $= 3.5$

$D(\text{meas.}) = 4.00$  $D(\text{calc.}) = 3.95$

*Optical Class:* Uniaxial (+); birefringence very weak. *Pleochroism:* Weak. $\omega = 1.759-1.760$

$\epsilon = 1.759-1.760$

**Cell Data:** *Space Group:* $P\overline{3}m1$ (synthetic).  
$a = 3.131$  $c = 4.608$  $Z = 1$

**X-ray Powder Pattern:** Vermion district, Greece.

2.335 (100), 4.61 (95), 1.755 (50), 2.708 (30), 1.563 (25), 1.480 (18), 1.336 (10)

(1) Vermion district, Greece; by electron microprobe, H$_2$O by the Penfield method. (2) Ni(OH)$_2$.

**Occurrence:** As coatings in chromitite in lenses in serpentinites (Vermion district, Greece); on chromitite (Hagdale quarry, Scotland).

**Association:** Magnetite, chromite, millerite, vesuvianite, chlorite, andradite–grossular, nickelifero us serpentine minerals, calcite (Vermion district, Greece); zaratite, reevesite, honessite, hydrohonessite (Hagdale quarry, Scotland).

**Distribution:** From the Vermion district, 50 km west of Thessalonike, Macedonia, Greece. In the Hagdale quarry, Unst, Shetland Islands, Scotland. At the Lord Brassey mine, Heazlewood, Tasmania, Australia.

**Name:** For Theophrastus, (ca. 371 BC–ca. 287 BC), the first Greek mineralogist.

**Type Material:** National Museum of Natural History, Washington, D.C., USA, 148460.
